Exp 3: Insurance Claim Request & Processing Management Using Zoho Creator Basic Fields

Subject: Low-Code Application Development | Form: Claim_Request_Form | Report: Claim_Request_Report

1. Objective and Approach

This report presents the design of an **Insurance Claim Request Form** in Zoho Creator that demonstrates the correct use of all thirteen Basic Fields in the Form Builder, while solving a real insurance-servicing problem: collecting and pre-processing claim requests from policyholders before a case reaches a claims officer.

The work follows four stages: structured intake using Basic Fields, validation and data quality, workflow automation with Deluge, and report-based claims processing. Each stage is explained with the field settings, formulas and scripts used.

2. Background and Problem Statement

An insurance branch office that accepts claims through physical paperwork and phone calls faces missing policy details, unclear incident descriptions, and delays in routing claims to the right team by claim type. No structured digital record exists before a case is assigned.

A low-code approach removes these gaps. The policyholder (or nominee) submits one online form that captures identity, contact details, policy details, the incident, the claim amount, available documents and a declaration of authenticity. Zoho Creator validates the data, stores it as a record in a report, and sends an acknowledgement, so the claims team starts from complete, searchable information.

Item	Details
Application Name	Insurance Claim Request & Processing Management
Form Name	Claim_Request_Form
Report View	Claim_Request_Report
Primary Users	Policyholders, Nominees, Claims Processing Team
Scripting	Deluge

Table 1: Scope of the application

3. Stage One: Structured Claim Intake with Basic Fields

Basic Fields are the core data-capture elements of the Form Builder. Table 2 maps each of the 13 fields to its role in the claim form.

#	Basic Field	Link Name	Purpose	Sample Value
1	Name	Claimant_Name	Full name (First / Last)	Lakshmi Narayanan
2	Email	Email_Address	Validated email for status updates	lakshmi.n@example.com
3	Address	Residential_Address	Address with city, state, pincode	7, Temple Street, Tirunelveli, TN, 627001
4	Phone	Contact_Number	Validated mobile number	+91 95000 33445

5	Single Line	Policy_Number	Short text policy number	POL-2024-778812
6	Multi Line	Incident_Description	Free-text incident account	Vehicle damaged in a collision near Anna Nagar
7	Number	Claim_Amount_Requested	Positive numeric amount	45000

241401084

#	Basic Field	Link Name	Purpose	Sample Value
8	Date	Date_Of_Incident	Date picker	15-Jul-2026
9	Time	Preferred_Callback_Time	Callback time slot	4:00 PM
10	Drop Down	Claim_Type	Single-select claim category	Motor Insurance
11	Radio	Claimant_Type	Mandatory exclusive choice	Policyholder
12	Multi Select	Supporting_Documents_Available	One or more documents	Photographs, Police FIR Copy, Repair Estimate
13	Checkbox	Declaration_Of_Authenticity	Truth declaration	Checked (Agree)

Table 2: Mapping of the 13 Basic Fields to the Claim_Request_Form

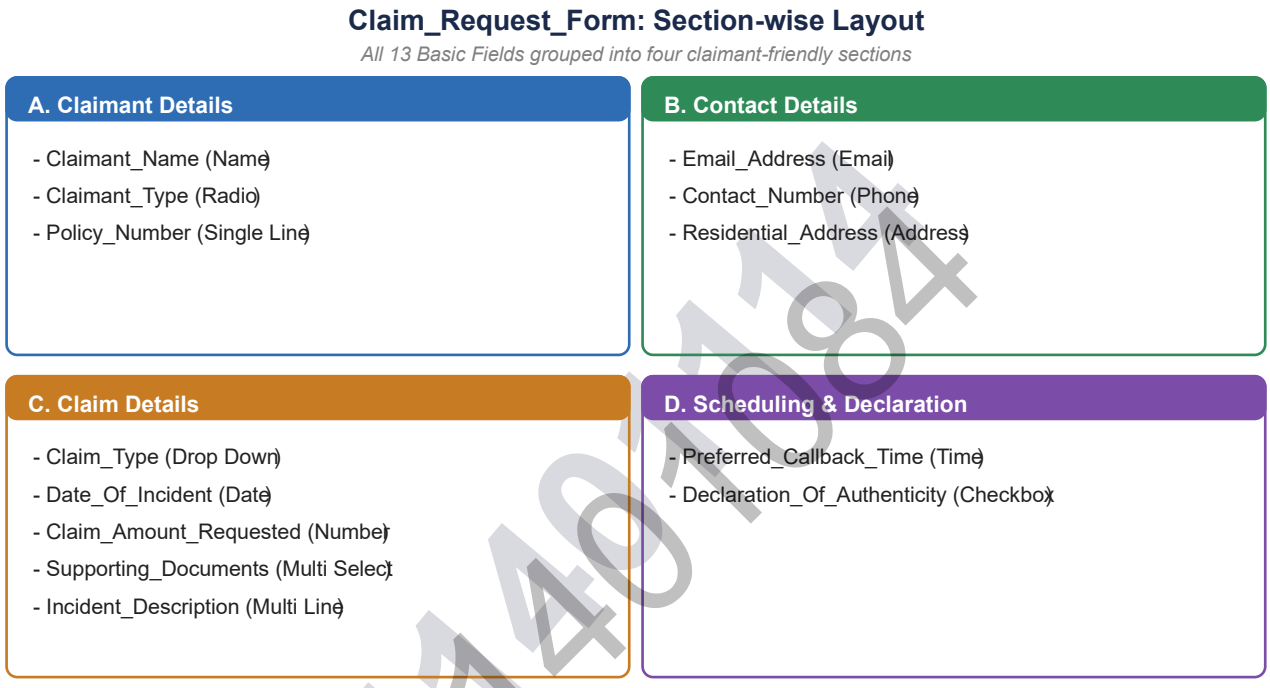

Figure 1: Section-wise layout of the Claim_Request_Form

3.1 Claimant Details (Section A)

The **Name** field splits the claimant's name into First and Last name sub-fields, which helps sorting and personalised emails. The **Radio** field (Policyholder / Nominee / Third Party) lets only one claimant category be chosen and shows all options at once. The **Single Line** field stores the policy number as text so that prefixes such as POL- and leading zeros are kept.

3.2 Contact Details (Section B)

The **Email** field checks the address format automatically. The **Phone** field applies the Indian country code (+91) and accepts digits only. The **Address** field stores line, city, state and pincode separately, so the report can be filtered by location to assign the nearest investigator.

3.3 Claim Details (Section C)

The **Drop Down** standardises the claim type (Motor, Health, Life, Property, Travel), allowing correct routing. The **Date** field provides a calendar picker, and the **Number** field accepts only numeric values so amounts can be sorted and filtered. **Multi Select** records several supporting documents at once, stored as a List in Deluge.

Multi Line captures the incident narrative in the claimant's own words.

3.4 Scheduling and Declaration (Section D)

241401184

The **Time** field records the preferred callback time. The **Checkbox** stores a Boolean (true / false) declaration that

4. Stage Two: Validation and Data Quality

Validation prevents incomplete or illogical records. Zoho Creator offers field properties (no code) and Deluge

Field	Rule	Configured Through
Claimant_Name, Contact_Number, Policy_Number, Claim_Type	Mandatory	Field property: Required
Email_Address	Valid email format	Built-in Email validation
Contact_Number	Country code format for India (+91)	Phone field format
Claim_Amount_Requested	Mandatory, positive values only	Required + Minimum value = 1
Date_Of_Incident	Mandatory, no future dates	Required + date range / On Validate
Declaration_Of_Authenticity	Must be checked to submit	Required + On Validate

Table 3: Validation rules for the Claim_Request_Form

A record is accepted only when all conditions hold together (logical AND):

```
R1:  Date Of Incident <= zoho.currentdate
R2:  Claim Amount Requested > 0
R3:  Declaration Of Authenticity == true
R4:  Claimant Name, Contact Number, Policy Number, Claim Type != null

Submit allowed  =  R1 AND R2 AND R3 AND R4
```

The following On Validate script enforces these rules; `cancel submit` stops the record from being saved.

```
if(input.Date Of Incident > zoho.currentdate)
{
    alert "Date of Incident cannot be a future date.";
    cancel submit;
}
if(input.Claim Amount Requested <= 0)
{
    alert "Claim Amount must be greater than zero.";
    cancel submit;
}
if(input.Declaration Of Authenticity == false)
{
    alert "Please accept the declaration before submitting.";
    cancel submit;
}
```

the information is accurate, which carries legal weight because false claims may amount to fraud. scripts for rules

that need logic.

4.1 Formal Validation Logic

241401084

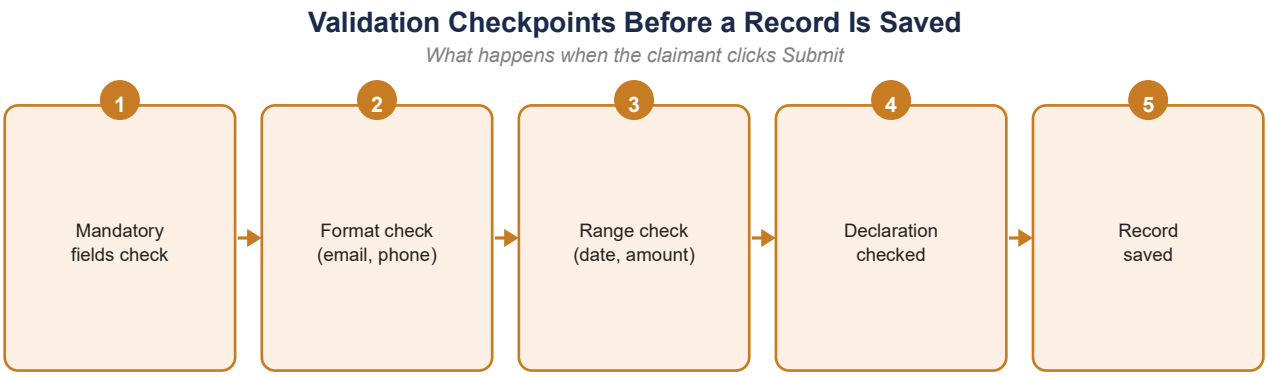

Figure 2: Validation checkpoints applied on submission

4.2 Useful Formulas

Purpose	Formula / Expression
Full name	Claimant_Name.first_name + " " + Claimant_Name.last_name
Claim reference number	"CLM-" + zoho.currentdate.getYear() + "-" + ID
Days since incident	zoho.currentdate.daysBetween(Date_Of_Incident)
Late-reporting flag	if(zoho.currentdate.daysBetween(Date_Of_Incident) > 30, "Late", "On time")
Priority by amount	if(Claim_Amount_Requested >= 100000, "High", if(Claim_Amount_Requested >= 25000, "Medium", "Low"))
Documents provided	Supporting_Documents_Available.size()

Table 4: Formulas used in workflows and reports

5. Stage Three: Workflow and Automation

The workflow turns a form submission into a managed claim request in six steps.

Step 1: The claimant opens the public form link from the insurer's website or servicing email.

Step 2: The claimant fills in personal, policy, incident and scheduling details across the four sections.

Step 3: On Submit, Zoho Creator validates mandatory fields and formats.

Step 4: A new record is created in Claim_Request_Report.

Step 5: An acknowledgement email with a reference number is sent to the Email Address value.

Step 6: The claims team filters the report by Claim Type and Claim Amount, assigns an investigator, and calls the claimant at the Preferred Callback Time.

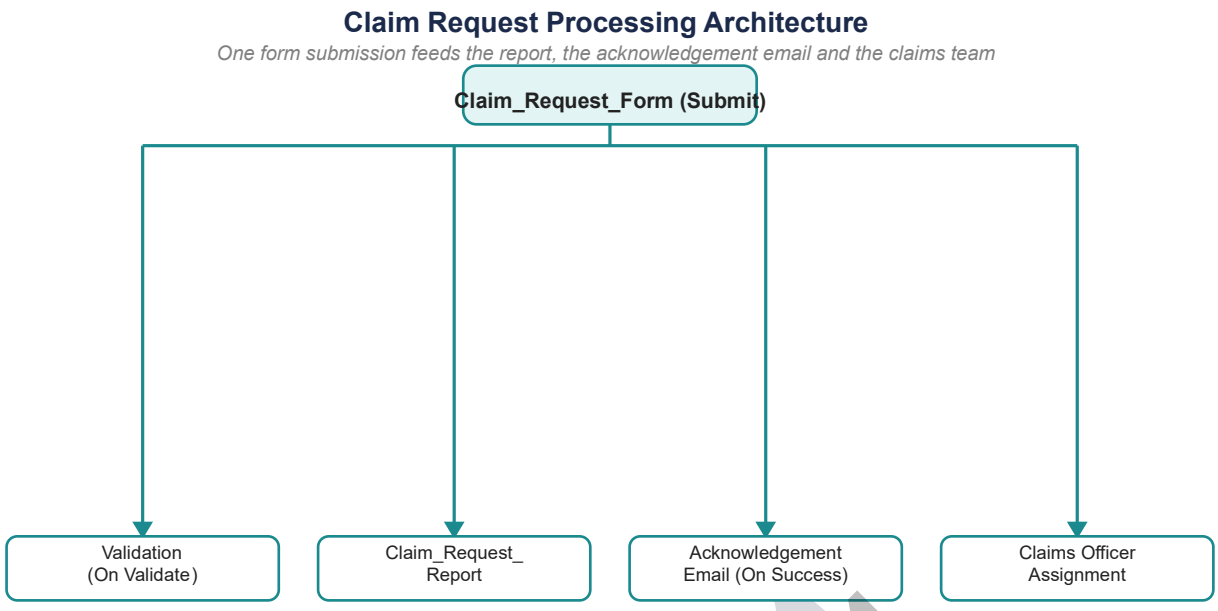

Figure 3: Claim request processing architecture

5.1 Acknowledgement Email (On Success)

```
refNo = "CLM-" + zoho.currentdate.getYear() + "-" + ID;
sendmail
[
    from : zoho.adminuserid
    to : input.Email Address
    subject : "Claim Request Received - Ref " + refNo
    message : "Dear " + input.Claimant Name.first name + ",<br>
        + "We received your " + input.Claim Type + " claim. Reference: " + refNo
        + ". Our officer will call you at " + input.Preferred Callback Time + "."
]
```

6. Stage Four: Report and Claims Processing

Creator generates a list report with the form. It is renamed **Claim_Request_Report** and configured for the claims team: columns for claimant, type, policy number, claim type, amount, incident date, contact and callback time; quick filters on Claim_Type, Claimant_Type, Date_Of_Incident and Claim_Amount_Requested; sorting by amount (descending); and grouping by Claim_Type. A criteria such as `Claim_Amount_Requested > 50000 && Claim_Type == "Motor Insurance"` lists high-value motor claims.

Field	Record 1	Record 2	Record 3
Claimant Name	Lakshmi Narayanan	Arun Kumar	Meena Sundaram
Claimant Type	Policyholder	Nominee	Policyholder
Policy Number	POL-2024-778812	POL-2023-551204	POL-2025-993301
Claim Type	Motor Insurance	Life Insurance	Health Insurance
Date of Incident	15-Jul-2026	02-Aug-2026	20-Aug-2026
Amount (Rs.)	45000	500000	82000
Documents	Photographs, FIR Copy, Repair Estimate	Death Certificate, ID Proof	Medical Report, Hospital Bills
Callback Time	4:00 PM	11:30 AM	2:00 PM

241401084

7. Testing

#	Input	Expected Result
T1	All fields valid, declaration checked	Record saved, email sent
T2	Date of Incident set to a future date	Alert shown, submission cancelled
T3	Claim Amount = 0 or negative	Rejected, not saved
T4	Declaration unchecked	Submission blocked
T5	Invalid email (lakshmi.n@example)	Email format error
T6	Policy Number empty	Mandatory field error

Table 6: Test cases for validation and workflow

8. Lab Record Deliverables

The lab record must contain screenshots of: (a) the form in Form Builder showing all 13 fields, (b) a live preview of the form, and (c) at least three submitted records in Claim_Request_Report.

(a) Form Builder with all 13 fields

(b) Live preview of the form

(c) Claim_Request_Report with 3+ records

241401084

9. Key Observations

- **Right field for the right data:** text, numeric, date, choice and Boolean fields each enforce a different kind of correctness at entry time.

- **Structured fields enable routing:** Drop Down and Radio values give the claims team clean categories to filter and assign.
- **Validation protects quality:** mandatory, format and range checks stop incomplete or illogical claims before they reach an officer.
- **Automation improves service:** an instant acknowledgement with a reference number reassures the claimant and reduces follow-up calls.
- **Low-code speeds delivery:** a working claims intake application is built mostly through configuration, with only short Deluge scripts for custom rules.

The Claim_Request_Form replaces paper and phone-based intake with a structured, validated digital record. Using all 13 Basic Fields, it captures claimant, policy and incident data at the first point of contact, while validation rules and the acknowledgement email improve data quality and communication. The Claim_Request_Report gives the claims team an organised view for filtering, verification and investigator assignment, showing how a low-code platform can deliver a practical business application with minimal scripting.
